## Problem 5

15.0 points possible (graded)

In this problem, you will implement a class according to the specifications in the template file [usresident.py](#). The file contains a `Person` class similar to what you have seen in lecture and a `USResident` class (a subclass of `Person`). `Person` is already implemented for you and you will have to implement two methods of `USResident`.

For example, the following code:

```
a = USResident('Tim Beaver', 'citizen')
print(a.getStatus())
b = USResident('Tim Horton', 'non-resident')
```

will print out:

```
citizen
## will show that a ValueError was raised at a particular
line
```

[usresident.py](#)

Paste only your implementation of the `USResident` class in the box

Programming Practices
▶ Midterm Exam
▶ Week 5: Object Oriented Programming
▶ Week 6: Algorithmic Complexity
▶ Week 7: Plotting
▶ Exit Survey
▶ Final Exam
▶ Sandbox

below. Do not leave any debugging print statements.

**For this question, you will not be able to see the test cases we run. This problem will test your ability to come up with your own test cases.**
